Migration processes management is an important public administration element. Migration affects many aspects of society — economics, public safety, and culture. Without a competent migration policy, a conflict between residents and migrants is inevitable in society. The problem of the relationship between migration flows and the level of socio-economic development of territories is considered herein. The data from the RIA Rating Agency and the Federal State Statistics Service of Russia are used in this study. The main research method is the correlation-regression analysis. As part of the study, the hypothesis that migration flows tend to the regions that are strong in terms of socioeconomic status has not been confirmed.

Key Words: Migration flows, migration, socio-economic development of the region.

Аннотация

Управление миграционными процессами является важным элементом государственного управления. Миграция влияет на многие аспекты жизни общества - экономику, общественную безопасность и культуру. Без грамотной миграционной политики в обществе неизбежен конфликт между резидентами и мигрантами. Здесь рассматривается проблема взаимосвязи между миграционными потоками и уровнем социально-экономического развития территорий. В исследовании использованы данные Рейтингового агентства РИА и Федеральной службы государственной статистики России. Основным методом исследования является корреляционно-регрессионный анализ. В рамках исследования не подтверждена гипотеза о том, что миграционные потоки стремятся в регионы с сильным социально-экономическим статусом.

Ключевые слова: миграционные потоки, миграция, социально-экономическое развитие региона.

Introduction

Russia's geopolitical position largely determines the intensity and dynamism of migration flows on its territory. Huge areas, the remoteness of large cities from each other, strong socio-economic differentiation of the regions leads to

increased migration movement of the population, both cross-country and in-country. Under these conditions, it is important to effectively manage migration flows in order not only to prevent the negative consequences of migration, but merely,

²³⁰ Associate Professor, Doctor of Law, Department of Criminal Proceedings, Pre-investigation Training and Research Complex, Volgograd Academy of the Russian Interior Ministry, Volgograd, Russia

to use it to increase the socio-economic status of the territories.

In this regard, it is possible to formulate the following problem for the purpose of state regulation of migration, namely, how to manage migration flows in order to ensure maximum social and economic development of the region. In addition, the interests of participants in the migration process should be taken into account in order to prevent social conflicts due to ill-conceived migration policies.

The formation and implementation of the state migration policy in the Russian Federation have been considered by domestic and foreign scientists. Generally, the works of scientists are aimed at studying the impact of labor migration on the country's economy and identification of positive and negative consequences (Massey, 2005; Obokata, 2010; Burda, 2014; Volokh, 2019; Ryazantsev, 2016). There are works that consider the risks associated with migration, mainly labor and low-skilled one (Follesdal, 2008; Galas, 2017) and its impact on the national security of the state (Martin, 2008).

The works related to the study of internal migration and its impact on the socio-economic situation of the territories (Todaro, 1980) should also be mentioned.

The studies are mainly concerned with the impact of intercountry labor migration on the state economy, however, the issue of the overall impact of migration on the socio-economic situation of the territory and migration management as a factor in increasing the socio-economic situation of the territory is poorly studied.

Moreover, before managing migration processes, the motives and interests of its participants (actually migrants, employers, government agencies, other participants) should be understood. It is important to determine the true interests of the participants in the migration process and their motives to regulate them effectively, although this is not as simple as it might seem at first glance. For example, the group of labor migrants includes several categories: there are those who come only to earn money, and then spend them in their main place of residence, also, there are those who come with the intention of staying, and therefore they earn money to buy housing, study and actively join the new socio-cultural space. In the first case, the migrant affects the economy mostly, while in the

second case, the migrant not only affects the economy, but also the social sphere.

The aim of the study is to determine the dependence of the socio-economic development of Russian regions on the migration processes and to form the conceptual approaches to population migration management based on them.

Methodology

The empirical base of the study is the analysis of the materials of the Main Directorate for Migration of the Ministry of Internal Affairs of Russia, international agreements, regulatory legal acts of the Russian Federation, as well as the expert materials of public organizations related to the migration sphere. In order to process the empirical material, quantitative and qualitative research methods were used.

The following data are used herein:

- 1) Rating of socio-economic situation in the regions (2017, 2018);
- 2) Data on migration in the Russian Federation (2017, 2018).

It should be noted that the rating of the socio-economic situation of the regions for 2017-2018, was compiled on the basis of an analysis of the array of indicators characterizing various aspects of the socio-economic situation in the subjects of the Russian Federation. As a result of the analysis, many key indicators have been formed that have made it possible to determine the position of the region according to the level of socio-economic development. The analyzed indicators are conventionally divided into 4 groups:

- Economic scale indicators;
- Economic efficiency indicators;
- Public sector indicators;
- Social sphere indicators.

The economic scale indicators combine the indicators, characterizing the absolute volumes of production of goods and services, the volume of the budget, the availability of labor resources, and the trade turnover in the region. The analysis of this group makes it possible to assess the scale of the economy of the subject of the Russian Federation and its contribution to the formation of all-Russian indicators. The group includes four indicators:

- The volume of production of goods and services;

- The volume of revenues of the consolidated budget;
- The number of people employed in the economy;
- The retail turnover.

The economic performance indicators combine the indicators, that characterize labor productivity, investment activity, and the financial situation of the enterprises in the region. An analysis of these indicators makes it possible to give a comparative assessment of the effectiveness of using the potential of the region. This group includes four indicators:

- The volume of production of goods and services per capita;
- The investment in fixed capital per capita;
- The share of profitable enterprises;
- The ratio of tax arrears to the amount of taxes and fees received in the budget system of the Russian Federation.

The budgetary indicators characterize the stability of the budgetary system, including the level of debt burden, the availability of own financial resources, and the volume of the revenue base. The source of information for the analysis of the budget system is the data on reports on the execution of the consolidated budgets of the constituent entities of the Russian Federation, published on the website of the Federal Treasury, which contain the operational information on the execution of the consolidated budgets of the constituent entities of the Russian Federation as of the end of the year, as well as the information on the volume of state debt of the constituent entities of the Russian Federation as of January 1 of this year, published on the website of the Ministry of Finance of the Russian Federation. When evaluating the budget system, the following indicators were analyzed:

- Consolidated budget revenues;
- The share of tax and non-tax revenues in the total revenue of the consolidated budget;
- The ratio of public debt to tax and non-tax revenues of the consolidated budget;
- The ratio of non-tax and tax revenues to the expenses of the consolidated budget.

The indicators of the social sphere and living standards of the population were evaluated on the basis of the analysis of the following indicators:

- The ratio of cash incomes of the population to the cost of a fixed set of consumer goods and services;
- Unemployment rate;
- Life expectancy at birth;
- Infant mortality rate;
- Mortality of the working-age population;
- The proportion of the population with incomes below the subsistence level.

Among the data of the Federal State Statistics Service on population migration for 2017-2018, characterizing migration processes, the following indicators were selected by region:

- Migration population growth, total;
- Migration growth of the population, total (women);
- Migration growth of the population, total (men);
- Migration growth of the population, total (urban population);
- Migration growth of the population, total (rural population);
- Migration growth of the population, total (interregional migration);
- Migration population growth, total (including CIS countries);
- Migration growth of the population, total (including foreign countries);
- Migration population growth, total (age from 0 to 14 years);
- Migration growth, total (age from 15 to 24 years);
- Migration growth of the population, total (age from 25 to 64 years);
- Migration growth of the population, total (age 65 years and older);
- Migration growth rate per 10,000 people.

Results and discussion

To determine the dependence of the socio-economic development of the regions of Russia on migration processes, a correlation and regression analysis of the impact of migration processes on the socio-economic development of the regions of Russia was carried out. The following hypothesis was laid down for this purpose: migration flows tend to the regions with a higher standard of living, that is, the higher the socio-economic situation of the territory, the more migrants tend to get there.

To test this hypothesis, the authors analyzed the data on the socio-economic situation of the regions (Rating of socio-economic situation in

the regions 2017, 2018) and data on migration growth according to the Federal State Statistics Service of Russia (Data on migration in the Russian Federation 2017, 2018). The indicated data for 2018 by regions are presented in Appendix 1. A preliminary analysis of the data and its presentation in the form of a graph (Appendix 2) makes it possible to identify the following leading migration regions: Moscow Region (105 479 people) Moscow (98 763 people), Krasnodar Territory (47 570 people), Leningrad Region (43 741 people), St. Petersburg (27 776 people).

Outsider regions: Omsk Region (-12 102 people), the Republic of Dagestan (-11 008 people),

Saratov Region (-10 348 people), Orenburg Region (-10 294 people), Tambov Region (-9 917 people).

However, to assess the impact of the socio-economic situation of the region on migration flows, the correlation analysis was carried out (Table 1).

Table 1. Correlation analysis of the socio-economic situation of the regions of Russia according to the rating compiled by RIA Rating and data on population growth

	Integrated rating of the socio-economic situation of the region according to the RIA Rating
Integrated rating of the socio-economic situation of the region according to the RIA Rating	1
Migration growth, total	0,468311
Migration growth, total (women)	0,469559
Migration growth, total (men)	0,464187
Migration growth, total (urban population)	0,46981
Migration growth, total (rural population)	0,345598
Migration growth, total (interregional migration)	0,432253
Migration growth, total (incl. Commonwealth of Independent States)	0,602656
Migration growth, total (incl. foreign states)	0,054928
Migration growth, total (age from 0 to 14)*	0,467477
Migration growth, total (age from 15 to 24) *	0,517654
Migration growth, total (age from 25 to 64) *	0,464565
Migration growth, total (age 65 and older) *	0,441386
Migration growth rate per 10,000 inhabitants	0,131687

Source: calculated by the authors

As can be seen from the correlation analysis, the strongest relationship between the socio-economic situation of the region and migration growth is due to the migrants from the CIS countries with a dependency level of 0.602656

and the migrants aged 15 to 24 with a dependency level of 0.517654. The remaining indicators of migration growth have a weak relation to the data on the socio-economic situation of the region.

Source: calculated by the authors

To identify the tightness of communication, the authors conducted a regression analysis on the above indicators (Tables 2, 3). However, a regression analysis showed that the indicators of migration growth due to migrants from the CIS countries ($R^2 = 0.36$, $F = 47.34$) and due to

migrants aged 15 to 24 years ($R^2 = 0.27$, $F = 30.38$) and the socio-economic situation of the region there is no stable connection and it is impossible to build a reliable mathematical model.

Conclusions

The hypothesis that migration flows tend to the strong regions from the point of view of the

socio-economic situation has not been confirmed. Moreover, this hypothesis was not confirmed by the data for 2017. It should also be noted that a correlation and regression analysis of

the indicators of migration growth and separately indicators (a total of 18 indicators) was carried out, making up the rating of the socio-economic situation of the regions of Russia. And on the basis of these data, it was also impossible to build stable mathematical models, which suggests that there is no stable relationship between migration processes and the socio-economic situation of the region.
